AI Tool Prompt Engineering Report

A. AI Tool Review

I chose ChatGPT because it is one of the most well-known large language models in our generation and the one I am most familiar with. I have used it several times for different academic and personal tasks, which made it easier for me to understand how it works and how to get the best results from it. Compared to other tools, I feel more comfortable and confident using ChatGPT because of my experience with it. Its popularity and accessibility also make it a reliable choice for various activities such as learning, writing, and generating ideas.

B. Original Prompt

“Create an image that shows a cat eating a chicken. Make the feeling dramatic and sarcastic at the same time.”

Output:

C. AI-Assisted Prompt

“Create a highly detailed, cinematic-style image of a cat eating a chicken. The scene should have a dramatic atmosphere, with strong lighting and shadows (e.g., spotlight or moody dark background) to emphasize intensity. The cat should appear expressive, almost overly serious or intense, while the situation itself feels ironic or absurd. Add subtle elements of sarcasm through visual contrast, such as exaggerated facial expressions, theatrical composition, or humorous details in the setting. Use high-resolution, realistic textures for the fur and food, and compose the image in a way that feels like a dramatic movie scene but with a humorous, sarcastic undertone.”

Output:

Analysis & Reflection

Personally, what I noticed from the two outputs is that the original prompt I wrote produced an image that felt more realistic and natural. The scene had more clutter in the background, which made it look like something that could actually happen in a real environment. Even though the prompt was simple and not very detailed, the AI still managed to generate an image that felt grounded and believable. The objects in the background, although not clearly defined, added to the overall realism because they created a sense of context and environment. On the other hand, the output generated from the AI-assisted prompt looked more dramatic but less realistic. The improved prompt included more specific instructions about lighting, mood, and style, which made the image appear more like a scene from a movie rather than something happening in real life. While this made the image visually striking, it also made it feel somewhat exaggerated and artificial. The dramatic lighting and intense composition took away some of the natural feel that was present in the original output. In terms of usefulness, it really depends on the goal of the image. If the goal is to create something realistic and relatable, then the original prompt performed better. However, if the goal is to create a visually impactful or artistic image, then the AI-assisted prompt is more effective. The improved prompt clearly influenced the clarity and depth of the output, as it guided the AI to focus on specific visual elements like lighting and emotion. Overall, this comparison helped me understand that prompt design plays a huge role in shaping AI-generated results. Small changes in wording can significantly affect the style, realism, and overall quality of the output.
