One-Page Website Creation &
Deployment using Replit

A. Initial Prompt

"Create a modern and visually appealing one-page e-commerce website that sells Spider-Man merchandise. Use a bold Spider-Man-inspired color scheme, primarily red, blue, black, and white, and apply it consistently across the entire design (backgrounds, buttons, text highlights, and sections). The website should look professional, dynamic, and similar to a real online store, with smooth animations and clean typography.

Include the following sections:

Home (Hero Section): Display a strong headline like "Your Ultimate Spider-Man Merchandise Store" with a short tagline and a call-to-action button such as "Shop Now." Add a Spider-Man mask icon or image near the title for visual impact.

About Spider-Man: Provide a short and engaging description of Spider-Man, his background, and why he is a beloved superhero.

Merchandise (Main Section): Showcase products in a grid or card layout. Each product should include an image, name, short description, price, and a "Buy Now" or "Add to Cart" button. Include the following items:

Spider-Man Mask

Spider-Man Figurines

Spider-Man LEGO

Spider-Man Poster

Spider-Man LEGO Set

Movies: Display a selection of Spider-Man movies with posters, titles, and release years in a clean layout.

Actors of Spider-Man: Highlight actors who portrayed Spider-Man, each with their name, image, and a short description.

Add a navigation bar with smooth scrolling to each section. Ensure the layout is responsive for both desktop and mobile devices. Include hover effects, subtle animations, and consistent use of the Spider-Man color theme throughout to create a cohesive and engaging user experience"

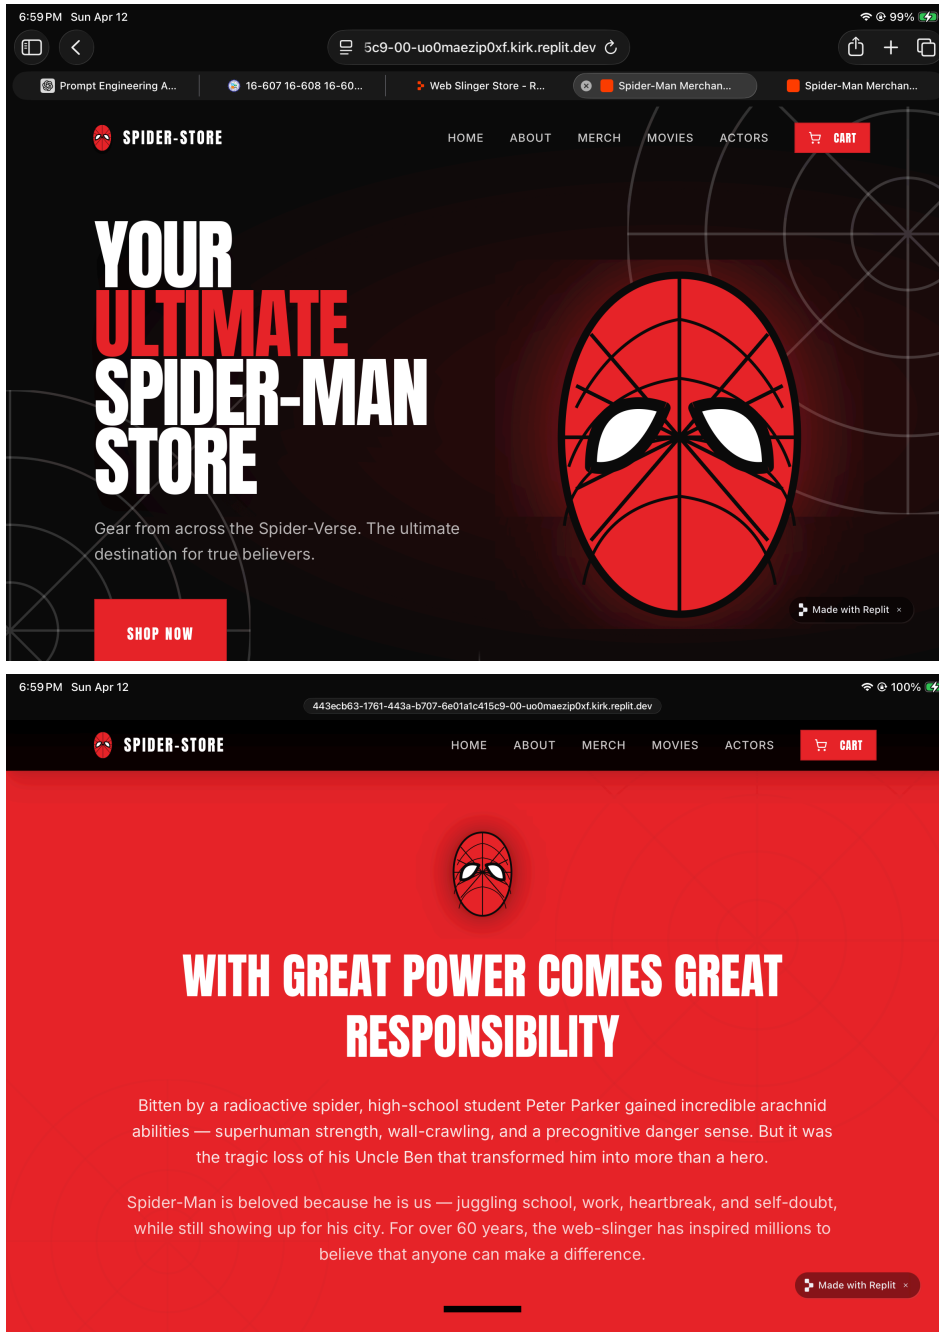

A. Refinement Prompts

"Ensure that all images and content strictly feature Spider-Man only, with no inclusion of any other characters. Use reliable image sources or valid URLs so that all images load properly without errors. Avoid broken links or missing assets, and make sure every image displays correctly across the website. And make sure the add to cart and check out system works properly."

"Make the cinematic universe use actual pictures of the movie posters of its stated movie."

C. Final Reflection

The overall output captured what I personally envisioned for the website in terms of its general idea and purpose, but it initially lacked many of the specific features and design elements I wanted. While the structure was somewhat correct, important details such as layout improvements, visual styling, and interactive components were either missing or not fully developed. The design also did not immediately match the theme and level of quality I had in mind, which made the first result feel incomplete. However, after going through a few prompt refinements, the output gradually improved. By making my instructions more detailed and specific, I was able to guide the AI to better understand what I was aiming for. Each refinement helped add missing features, improve the layout, and enhance the overall design. I also learned that wording your prompt properly and knowing exactly what you want is very important, as it directly affects the overall output. When the prompt is vague, the results tend to be less accurate or incomplete, but when the prompt is clear and specific, the AI is able to generate a more polished and relevant outcome. Eventually, the final output became much closer to my original vision, showing that clearer and more structured prompts lead to better and more accurate results.
